

## **Interneer releases the latest version of its acclaimed Interneer Intellect BPM Platform**

*Interneer introduces the new and powerful version 6.5 which simplifies even further integration to other products and expands its reporting capabilities.*

Culver City, CA – April 26th, 2010 - Interneer, Inc., a leading provider of human centric Business Process Management (BPM) software, announced today the availability of the latest release of its Interneer Intellect BPM Platform. This new release builds on the vision of the company to provide a powerful BPM platform which empowers non-technical users to create sophisticated BPM applications. With this release, Interneer has introduced new features that provide a more powerful report generator, a requirements and change management module as well as easier integration with external applications and mashups.

Customers can generate reports, with custom field queries and display charts, in just a few mouse clicks. The requirement and change management module guides the analyst through a BPM configuration from concept through actual implementation and deployment. In addition, by leveraging web services and linked server technologies, business analysts can quickly access external data sources, look up data in real time, or call and pass data to external HTML objects and display them within the platform pages.

"Integration has always been one of the most difficult and complex tasks in a BPM implementation," said Romeo Elias, President, Interneer. "With our latest release of Interneer Intellect, we have simplified this process considerably, enabling business analysts to configure a system to access data from various sources without having to code, learn databases or interfaces. Along with our full Application Programming Interface (API), Web Services interface and Import/Export capabilities, this latest offering rounds out the platform's core integration capabilities."

Interneer Intellect, which is available either on-premise as licensed server software or as a hosted service, is a 100% Web-based solution designed specifically for non-technical business analyst type users. The integrated platform comprises all the components required to model, design, manage, execute and automate a comprehensive BPM solution. Companies using the platform define, configure and automate business processes in far less time and with less expense than other platforms, in a fully drag and drop environment with absolutely no programming.

For more information about Interneer Intellect V6.5 or to request a demo, please contact Interneer at 310-439-9680.

### **About Interneer, Inc.**
